Supervisory Patent Examiner, Art Unit 2624

[1] This office action is in response to the Request for Continuation Examination filed on 3/16/10. The arguments made by applicant and claims amendments are entered and made of record.

[2] RESPONSE TO APPLICANT'S ARGUMENTS

I. On page 16 of the reply, the applicant stated: "In this response the Applicant respectfully maintains the assertion that Buhrke is inapplicable as a reference. First of all, the Applicant notes that Buhrke is directed to the area of speech recognition while Roy and the present claims are directed to the area of image processing. As such the Applicant respectfully submits that one of ordinary skill in the art of image processing would not consider a teaching in the speech recognition arts as relevant to image processing. Specifically, the "graphs" shown in Buhrke have nothing to do with images and the disclosures therein are not transferable to images."

The examiner partially agrees with the applicant, since the amended claims now includes "... the computing comprising applying a geometric three plane model to distinguish *non-fronto-parallel matched moves from occluded moves between adjacent pixels in the stereo disparity model.*" To note, many known speech recognition techniques are also used in image processing, such as filtering, convolution, edge detection, noise removal, etc. The only difference between speech signals and image signals is the number of dimensions, speech signal is represent in one dimension and images are represented in two dimensional signals.

II. In view of the claims amendments, the examiner will withdraw rejections, Roy (US pat no 6,046,763) in view of Buhrke (US pat no 6,006,181), on the claimed limitations, since there are not suggestions in Buhrke to show that dynamic programming should be use in the field of stereoscopic image pair matching.

[3] REASONS FOR ALLOWANCE

Claims 1-45 are allowable.

With regards to claim 1, the examiner cannot find any applicable prior art providing teachings for the following limitations:

computing a minimum cost path in a stereo disparity model between a scan line of a first image and a corresponding scan line of a second image of a stereo image pair, the stereo disparity model distinguishing between non-fronto-parallel matched pixels in each scan line and occluded pixels in each scan line, the computing comprising applying a geometric three plane model to distinguish non-fronto- parallel matched moves from occluded moves between adjacent pixels in the stereo disparity model.

With regards to claims 16 and 31, see the rationale for claim 1.

[4] RELEVANT ART

I. Matsushita (US pat no 7,620,247): Matsushita reads on computing a similarity calculation using scan lines of a first image and a corresponding scan lines of a second image

pair and the computing comprising applying a geometric three plane model, as shown in figures 15A-15C. The test image, query image and line penalty matrix are read as the three 'geometric plane models.' The distance between the label matrices of a label sequence (feature sequence) "ABCDE" in the first line of the query image, and a label sequence "abcde" in the first line of the test image is calculated by Dynamic Programming matching, and are stored at a corresponding position of a line penalty matrix (two-dimensional matrix; see FIG. 15C) as a line penalty. However, Matsushita does not qualify as a prior art.

[5] Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
